# Daily Stand Ups

As a rule of thumb, face to face interaction is encouraged because allows richer communication and discussions, whereas written feedback tends to be slower and more restricted.

For each team member to share progress towards the teams goals, usually using the following format:

What I did yesterday…..

What I will do today…..

Are there any impediments?……

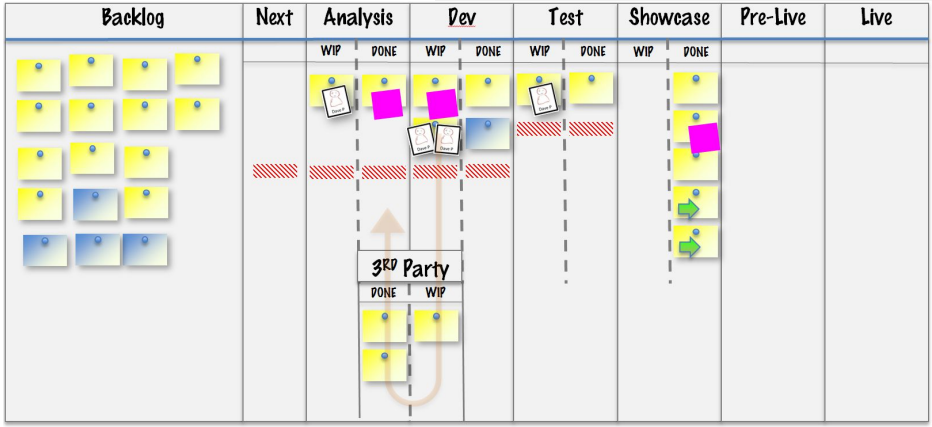
# Agile Boards

Agile boards (whether physical or electronic) should be highly visible and radiate information.

They show the current state of delivery in terms of work left to do, items being worked on, and items readied for release.

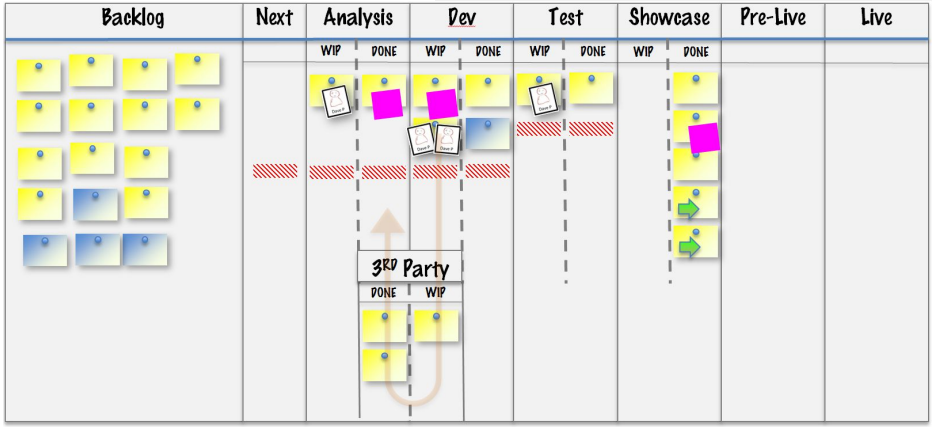
Software for generic Agile boards and those for popular approaches such as Scrum and Kanban are readily available and often free to use.

Physical boards can be made by adding a bought or home made template to a whiteboard or wall.



# Agile Boards

Boards can be used during daily stand-ups as well as in planning meetings. Work items can be moved by team members as they begin to work on an aspect of a work item/story. Eventually items move to a done column, but only when signed off by a customer.



# Sprint Planning

## Sprint Planning

1

Top down

The number of stories to be worked on is established based on: The estimated size of the stories (in units known as story points) and the velocity of the team (the number of story points it can complete within a sprint)

2

Bottom up

The team calculate in detail the available hours across the team for the duration of the sprint, then check this against a detailed work plan for all the tasks for a predetermined set of user stories/features. Then adjust by adding or removing stories.

# Show and Tells

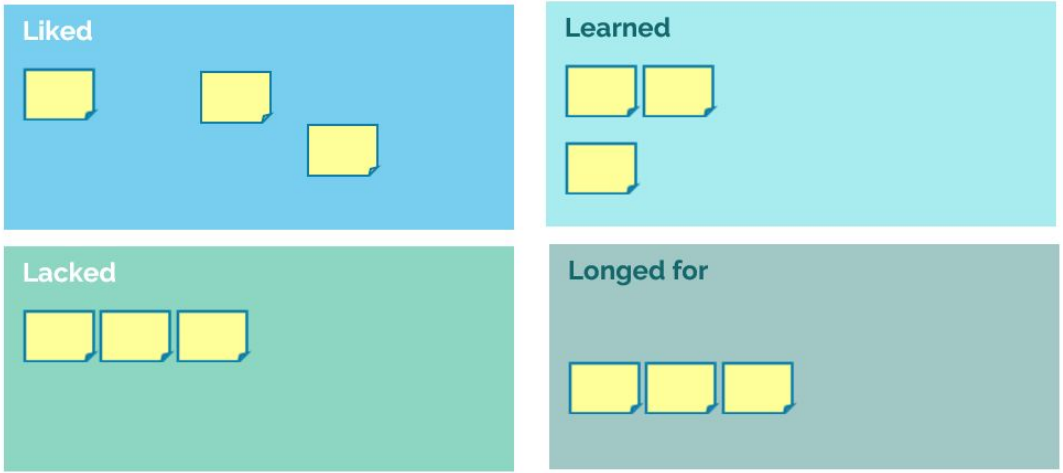
These are typically conducted at the end of each iteration, they can also be used for an increment before it is deployed.

They demonstrate the work that has been produced. They are usually based on working software, demonstrated on a simulated environment with simulated data. All relevant stakeholders should be given the opportunity to attend these meetings because it may be their last opportunity to change things before they are deployed.

# Retrospectives

Retrospectives are generally used at the end of each iteration and provide a method of capturing the teams' thoughts on the way they have worked.

The aim is to reflect on the work done and the way it was done in order to establish good practice that should continue, identify any practices that didn't work well and be stopped and to consider new ways of doing things.



# Agile Coaching

Agile teams need to focus on communication, collaboration and team dynamics. This eventually becomes natural, but when first adapting to Agile ways of working, teams may benefit from an Agile coach. The coach works alongside the team and guides them through. Coaches do not carry out the work themselves.

A coach can even add value to established teams by facilitating Agile activities and introducing new Agile techniques.

# Backlog Refinement

## Continuous Refinement:

- Stories can be added, reprioritised or changed at any time before they are delivered

## YAGN

- You ain't gonna need it (YAGNI).
- Is the feature really needed and what value does it add?

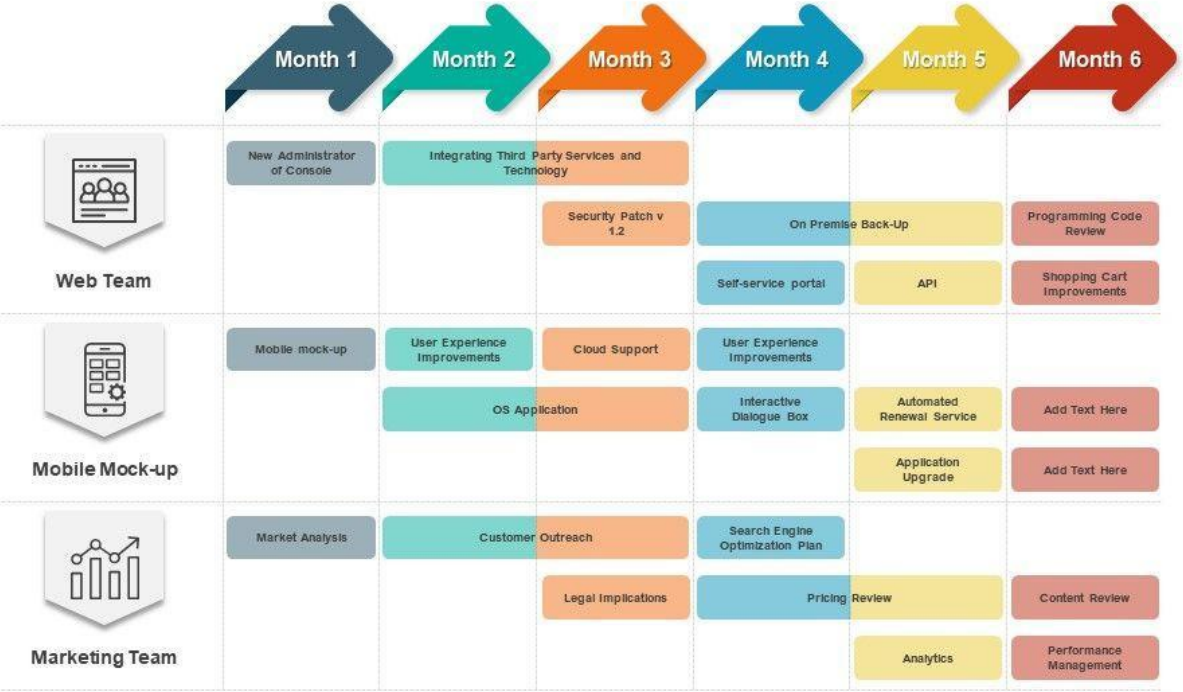
## Spikes:

- A Spike is created when further investigative work is needed to break down a story

## Readied for the sprint:

- Elaboration and refinement of individual stories often happens just before the sprint that will develop the feature

# Product Roadmaps

A product roadmap maps out the key goals that your product is aiming to deliver at points in time, thus showing a high level view of the product's vision and direction.


Although primarily a strategic document. The product roadmap will aid prioritisation of the product backlog items and iteration planning
